PROJECT OVERVIEW:

Vibe Downloader Pro is a high-performance media acquisition tool built with *Python* and the *Flet* framework by utilizing the *yt-dlp* engine to provide a streamlined, three-column interface for downloading *AUDIO*, *VIDEO*, and *PLAYLISTS* from many online locations - including YouTube, Vimeo, TikTok, Instagram, Dailymotion, Twitch, Reddit, Twitter/X, Facebook, SoundCloud, and 1000+ more sites.

Technical Specifications

- **Language:** Python 3.10
- **UI Framework:** Flet (Flutter for Python)
- **Download Engine:** yt-dlp
- **Version Control:** GitHub
- **Terminal:** PowerShell 7.x

TERMINAL OUTPUT REVIEW SHORTCUT:

As you may or may not know, ChatGPT and other AI Chatbots of choice do not work with terminal outputs on Windows - here is the workaround code to get your chatbot to look through your entire terminal output for review/troubleshooting steps.

1. Run the following code in PowerShell - *If you have any issues or get lost in the weeds*

a. YOU WILL NEED TO CHANGE THE DIRECTORIES TO ONES THAT MATCH YOUR DESIRED LOCATION - BELOW C: PATHS ARE JUST FOR REFERENCE

Copy-paste this into PowerShell to generate your AI-ready log

```
$LogPath = "$HOME\Desktop\TerminalLog.txt"
```

```
"-----" | Out-File $LogPath -Append
```

```
"Terminal Audit - $(Get-Date)" | Out-File $LogPath -Append
```

This audits your specific project directory

```
Get-ChildItem "C:\Users\ander\VibeDownloader\GitHub Repository" -Recurse  
-ErrorAction SilentlyContinue |
```

```
Select-Object Name, @{Name="Size(MB)";Expression={[math]::Round($_.Length /  
1MB, 2)}} |
```

```
Out-File $LogPath -Append
```

```
"-----" | Out-File $LogPath -Append
```

2. Every time you run this code, PowerShell will overwrite/update the .txt log with the latest timestamp - no excessive file backlog cluttering up your desktop or computer.
3. Once the new file is on your desktop, drag the .txt file into your AI chatbot of choice and prompt it with "Look at terminal output".

4. Once your AI of choice reads through the output, it will reply and will give you troubleshooting steps, allowing you to move on ... at least until the next headache.

User Path - Easiest

- **File Portability:** The compiled version is approximately **94.47 MB**, making it a portable single-file solution for Windows - Simply move the "Vibe Downloader Pro.exe from the dist folder of the GitHub Repository to anywhere on your computer and open it
 - *Windows only for now - we are currently working on Mac & Linux distributions.*
- **Standalone Executable:** Users can run the **Vibe Downloader Pro.exe** directly from the **dist** folder without a local Python installation or copy this file into your program files or anywhere else on your computer and open it if you prefer
 - *This build will work **AS IS** only with video downloads currently - to enable Audio downloads you will need to install FFmpeg on your device.*
- **FFmpeg Installation:**
 1. **Search for the official FFmpeg package using Winget.**
 - a. This confirms the package is available in the Windows community repository before we pull the trigger.

winget search ffmpeg

2. **Execute the silent installation of FFmpeg.** This command handles the download and automatically configures your Environment Variables so the "Audio" vibe actually works.

winget install -id Gyan.ffmpeg -e -source winget

3. **Verify the installation and version.**

- a. You'll need to restart your terminal (or Warp) for the PATH changes to take effect, then run this to confirm.

`Ffmpeg -version`

Developer Path - Tinkering & Customization:

- Don't like the app and want to tweak it, go right ahead.

BE SURE TO MAKE A COPY OF THE ORIGINAL BEFORE YOU DO THIS

Otherwise you risk a lot of headaches when the script or compile fails

- Simply open the “*Vibe Downloader Version 1.0.0.py*” Python File in *Notepad* and edit or replace the script inside.
- From there, you will have to rebuild and redeploy the app
- **Environment Setup:** Install Python 3.10+ and the required libraries via

`pip install flet yt-dlp pyinstaller.`

- **Source Logic:** All UI elements and download profiles are contained within the *Vibe Downloader Version 1.0.0.py* source file.
- **Testing:** Execute the script directly in a terminal to see real-time changes.

Deployment Instructions:

- **Repository Management:** Use the provided `.gitignore` to exclude the **100 MB+** build and dist folders from your GitHub history.
- **Version Tracking:** Ensure Git is installed on your Windows system before attempting to push the source code to GitHub.
- **Compilation Command:** Use `pyinstaller --noconsole --onefile --clean` to generate a fresh standalone executable from the source.=

Ground Zero - Build-From-Scratch Blueprint:

- *For those who want to practice their skills and/or build it themselves*

Phase 1 - The Infrastructure:

Before writing a single line of code, your local machine must be configured with the necessary engines.

- Python 3.10+: Install the latest stable version of Python and ensure "Add to PATH" is checked during installation.
- FFmpeg: This is non-negotiable for audio extraction. Download the FFmpeg essentials, extract them to a permanent folder (e.g., `C:\ffmpeg`), and add the `bin` folder to your System Environment Variables.
- Git: Install Git for Windows to manage version control and handle the GitHub push.

Phase 2 - Environment & Dependencies:

Open your terminal (Warp or PowerShell) and create a dedicated directory for the project.

```
mkdir "C:\DESIRED LOCATION"
```

```
Cd "C:\DESIRED LOCATION"
```

```
Pip install flet yt-dlp pyinstaller
```

Phase 3 - The Source Code Implementation:

Create a file named `VibeDL_V6.py`. This script handles the 3-column UI logic and interfaces with `yt-dlp` for media acquisition.

- UI Logic: Uses Flet to build a responsive dark-themed dashboard with three distinct columns for Audio, Video, and Playlists.
- Quality Profiles: Integrates a dropdown selector that maps user choices to `yt-dlp` format strings (e.g., `bestvideo[height<=1080]+bestaudio/best`).
- Feedback Loop: Utilizes progress hooks to update a real-time progress bar and status text during the download.

Phase 4 - Production Compilation:

To convert the Python script into a standalone 94.47 MB Windows executable, use the following PyInstaller command:

```
pyinstaller --noconsole --onefile --clean "NAME OF FILE.py"
```

Phase 5 - GitHub Staging

A professional repository requires metadata to stay clean and informative.

- README.md: Create this file to document features, prerequisites (FFmpeg), and installation steps.

- .gitignore: Crucial for excluding the 113 MB+ **build/** and **dist/** folders from your Git history to avoid repository bloat.
- Push: Initialize git, commit your files, and push to your remote GitHub URL.

Step 1: Perform the final repository sync.

"C:\DESIRED GITHUB REPOSITORY LOCATION"

```
git add .
```

```
git commit -m "Full Build Pipeline Document - v1.0.0"
```

```
git push origin main
```
